# WeRateDogs

You've probably wondering why would anyone rate dogs. On what standards or criteria we can rate this beautiful, loyal and wonderful creatures. Rating dogs will be a very confusing and stressing thing to do in my opinion, yet those people who did it on twitter had a very different opinion.

A Twitter account named WeRateDogs simply did that, they rated dogs and they made their own criteria, and surprisingly they attracted more than 7.48 million viewers from all over the globe reading this page, rating dogs, retweeting tweets and adding it to favorite.
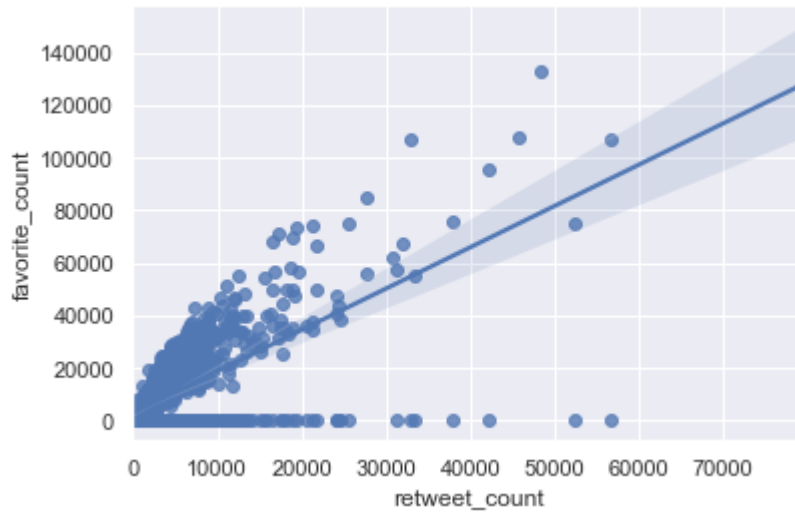

And with a very strange rating system which has no standards what so ever, they rated those cuties out of 10, 20, 190 and 666 (weird), cause they think their dogs are good enough for getting this high rates.

The account has over 6 million follower and people tweeted from all the globe to post about their (in their own point of view) rare dogs, puppers, floofers, and obviously doggos. The popularity of this account has attracted our attention to analyze their tweets to gather some info about these amazing creatures, sometimes they post some photos of other animals or stuff and it's hillarious.
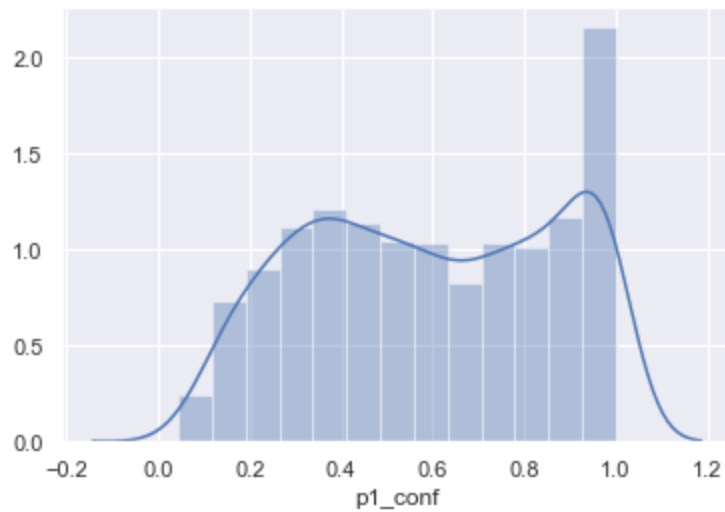

We gathered these data and got some insghts,

This graph above for the distribution of sources from which these data was gathered. Most of of tweets is from iPhone twitter app, around 94% in the total, unlike other sources like Vine, Twitter web, and TweetDeck which had less popularity.

This plot is showing number of retweets vs favorite tweets counts, Which shows the correlation between 'retweet_count' and 'favorite_count'. Some high values are showing a strong positive relationship between 'retweet_count' and 'favorite_count'.

The above plot is showing the top 10 dog breeds on the account. Golden retriever and Labrador retriever topped the list, which are the most common breeds in U.S.
